

TransactX Scope of Business

Effective Date: June 5, 2026

Last Updated: May 31, 2026

1. About TransactX

TransactX (“we”, “our”, or “us”) is a financial technology platform operated by TrackVault Limited (RC Number: 6997898), a registered business entity located at 8, Osara Junction, Gbonogun Community, Obantoko, Abeokuta, Ogun State, Nigeria.

Our platform is designed to simplify how individuals and businesses manage transactions, payments, and financial operations within a centralized environment.

We provide structured financial management, payment, transaction, and operational support services through a centralized technology platform designed for individual and business users.

TransactX operates as a financial technology platform and does not function as a licensed deposit-taking financial institution. The platform currently operates within the Nigerian financial ecosystem through integrations with financial infrastructure and service providers to deliver secure, accessible, and user-focused financial solutions.

Availability of certain Services may be limited to jurisdictions where the platform is operationally or legally supported.

1.1 Regulatory Positioning

TransactX operates as a financial technology platform and does not function as a licensed deposit-taking financial institution. Its services are delivered through integrations and partnerships with licensed financial institutions, payment service providers, Open Banking providers, and other regulated financial infrastructure partners where applicable.

TransactX is committed to conducting its operations in accordance with applicable laws, regulatory requirements, compliance obligations, anti-money laundering standards, consumer protection requirements, data protection obligations, and other regulatory expectations relevant to its activities within the Nigerian financial ecosystem.

As the platform evolves and expands its services, additional regulatory approvals, partnerships, registrations, licences, or compliance measures may be adopted where required by applicable laws or regulatory directives.

2. Core Services

TransactX provides a range of financial management and transaction-related services designed to support both individual and business users.

2.1 Wallet and Account Management

The platform operates on a wallet-based system that enables users to hold, manage, and connect multiple accounts within a centralized environment. This provides users with a comprehensive view of their financial activities while supporting seamless transactions, including sending and receiving funds. User wallet infrastructure and account balances are supported through licensed financial infrastructure partners.

By consolidating these functions within one platform, TransactX simplifies financial management and reduces the need to rely on multiple financial applications.

2.2 Transactions and Payments

TransactX enables users to perform various financial transactions, including peer-to-peer transfers, bill payments, and other payment-related activities.

The platform is structured to improve transaction visibility by providing users with clearer insight into transaction status and payment activity, thereby reducing uncertainty associated with delayed confirmations or failed transactions.

2.3 Sub-Account Functionality

TransactX provides users with the ability to create and manage sub-accounts within their primary account structure.

This functionality allows individuals and businesses to organize funds for different purposes such as savings, expenses, operational budgets, payroll, or project-based activities. By enabling structured allocation of funds, the platform improves financial organization and reduces reliance on manual tracking methods.

2.4 Business Financial Operations

The platform supports businesses by providing tools that simplify operational financial processes.

These services may include payroll management, invoice generation, transaction tracking, and other financial workflow support tools designed to improve operational efficiency and financial oversight for business users.

2.5 Transaction Monitoring and Insights

TransactX incorporates monitoring tools that allow users to track financial activities and maintain visibility over transactions in real time.

These monitoring features are designed to improve financial awareness, support better decision-making, and assist users in identifying irregularities or unusual transaction patterns.

2.6 Integrated Financial Infrastructure

TransactX integrates with licensed financial service providers and Open Banking partners to facilitate secure account services and connectivity, payment processing, identity verification, and related operational functionality across the platform.

These integrations currently include regulated third-party financial infrastructure providers such as:

- **Safe Haven**

Wallet and account functionalities available through TransactX are provided by Safe Haven enabling the creation and management of virtual accounts, transaction processing, wallet funding, transfers, and other regulated financial operations within the platform ecosystem.

User wallet balances and related financial activities are supported through partner banking infrastructure rather than internally maintained financial storage systems.

Additional financial operations such as transaction monitoring, account management, and payment processing may also rely on this infrastructure integration.

- **Mono**

Linking of accounts and certain other financial connectivity features are made available on the platform through secure Open Banking integrations provided by Mono.

These integrations allow users, under consent and applicable authorization procedures, to securely connect supported bank accounts to the platform for selected financial operations and account-related services.

Depending on feature availability and applicable permissions, connected account functionality may support:

- account verification;
- transaction insights;
- financial activity monitoring;

- account authentication;
- balance visibility;
- payment-related operations;
- financial analytics and operational automation.

Bank account connectivity processed through authorized third-party infrastructure remains subject to applicable security procedures, banking requirements, regulatory obligations, and user authorization controls.

TransactX does not independently access or control banking credentials supplied during external account authentication processes handled through authorized Open Banking providers.

Additional integrations with regulated financial infrastructure providers, payment processors, identity verification providers, Open Banking partners, and related technology service providers may be introduced from time to time to support the expansion, reliability, security, and functionality of the platform.

By leveraging existing financial infrastructure, TransactX is able to deliver efficient and accessible financial services while improving operational reliability within the Nigerian financial ecosystem.

3. Service Availability

At present, TransactX is primarily designed to support users operating within Nigeria. Certain services and functionalities may be subject to availability, infrastructure dependencies, verification requirements, and applicable regulatory considerations.

Availability of certain integrations or banking functionalities may depend on supported financial institutions, user verification status, jurisdictional limitations, operational availability, and third-party provider support.

4. Target Users

TransactX is designed to support a broad range of users with varying financial management needs.

4.1 Individuals

Individuals seeking a structured and efficient way to manage personal financial activities can use the platform to manage transactions, organize funds, monitor expenses, and perform everyday financial activities within a centralized environment.

4.2 Small and Medium-Sized Enterprises (SMEs)

Businesses requiring tools for transaction management can utilize the platform's operational tools to manage payroll, monitor transactions, allocate funds through sub-accounts, and improve financial organization.

4.3 Service Providers and Organizations

Service-based businesses and organizations seeking improved visibility, operational efficiency, and centralized financial management capabilities can leverage TransactX to streamline payment collection, monitor financial activity, and maintain improved visibility across operations.

5. Value Proposition

TransactX aims to deliver value by providing users with a centralized and structured financial management experience.

The platform is designed to:

- simplify financial operations within a single environment;
- improve visibility and control over financial activities;
- reduce reliance on multiple financial applications;
- support better financial organization through structured account management;
- improve operational efficiency for both individuals and businesses.

TransactX is positioned as a structured financial management platform that delivers centralized transaction management, financial organization, payment facilitation, and operational support services through a unified digital environment. The platform's objective is to improve efficiency, visibility, accessibility, and operational control for individuals, businesses, and organizations utilizing its services.
